

ABSTRACT

A wireless casino information management system and method for conducting casino business at any location within a casino. The system includes a host server having a memory, a database associated with the memory, data relative to the casino business stored in the memory in accordance with the database, at least one handheld computing device capable of being transported to any location within the casino, and a wireless communication system operably coupled between the host server and the handheld computing device, the wireless communication system configured for bi-directional communication of the casino business data between the host server and the handheld computing device. The method for conducting casino business at any location within a casino includes the steps of establishing bi-directional wireless communication between the host server and the handheld computer device, and communicating the casino business data between the host server and the handheld computing device.
